The University of Minnesota’s Summer 2016 Institute in Biostatistics (SIBS) will provide six-weeks of training in biostatistics, epidemiology and statistical computing.

You will learn from core faculty who will provide you with a foundation in biostatistical methods and computing. Additionally, you will have multiple opportunities to interact with a variety of prominent scientists working on heart and lung research studies.

Our program includes field trips to organizations that hire biostatisticians, seminars by scientists working on major heart and lung projects, and advice on applying to graduate school.

**Tuition, housing, meals, travel (up to $800), and extracurricular activity costs are all covered by the program.**

### Why biostatistics?

Biostatisticians design, implement and analyze studies in medicine and public health in collaboration with other scientists.

There is a national shortage of biostatisticians. As a result, many career opportunities are available in academia, government and industry.

According to the March 2015 Amstat News salary survey, the median salary for master’s level academic biostatisticians is $71,700 and $84,200 for PhD-level, academic non-faculty. Salaries in non-academic settings are higher.
